

EUDR due diligence connected to the supply chain behind every product

Powered by your EUDR Compliance Agent

From 30 December 2026, large and medium upstream operators must complete due diligence before placing in-scope products on the EU market or exporting them. Resilinc connects product, supplier, site, and evidence data to help teams identify exposure, close gaps, and prepare approved records for DDS submission.

One workflow from exposure screening to an approved due diligence record:

- ✓ Cattle
- ✓ Cocoa
- ✓ Coffee
- ✓ Oil palm
- ✓ Rubber
- ✓ Soya
- ✓ Wood

One workflow from exposure screening to an approved due diligence record:

Sense

Identify exposure - Screen legal entities, transactions, products, CN or HS codes, and supplier paths to find likely EUDR obligations.

Recommend

Assess and close gaps - Collect required origin and legality evidence, assess risk, and route mitigation until the operator reaches no or negligible risk.

Act

Identify exposure - Screen legal entities, transactions, products, CN or HS codes, and supplier paths to find likely EUDR obligations.

What to expect: EUDR compliance deadlines

Obligations attach to whoever first places relevant products on the EU market or exports from it, whether based in the EU or supplying into it.

- **30 Dec 2026:** Obligations apply to large & medium operators, traders and all downstream actors
- **30 Jun 2027:** Micro & small operators and natural persons, for non-timber products
- **2026 onward:** Enforcement checks: 1% of operators (low-risk origin), 3% (standard), 9% (high-risk)

From scattered data to a complete, auditable due diligence record

Product codes, orders, supplier records, plot data, and legality evidence often sit in different systems. Resilinc connects them to the relevant product and operator so teams can complete due diligence and preserve the evidence behind each decision

- **Know where you're exposed:** See which transactions, materials, products, suppliers, sites and regions may fall in scope across your multi-tier supply chain.
- **Reduce manual compliance work:** Coordinate supplier requests, evidence checks, approvals, and status in one workflow instead of reconciling separate files and emails.
- **Focus on the gaps:** Prioritize missing traceability, sourcing, geolocation, legality and supplier evidence so teams know what requires action.
- **Protect supply continuity:** Focus verification and remediation on the relationships that keep production running, not every missing data point.
- **Verify only what matters:** Limit supplier effort to EUDR-relevant supply paths and Validate every confirmed in-scope path without surveying the rest of the network.
- **Prove it months later:** Track every decision and gap you close with a durable audit trail.

December 30, 2026 deadline. Supplier onboarding, geolocation collection and evidence remediation run in quarters, not weeks.

How Resilinc's EUDR solution works

🕒 Sense: Find what is in scope

Exposure discovery

Products, parts and suppliers screened against EUDR commodity and HS/CN applicability.

Obligation mapping

Assemble the data needed to determine whether the entity is the upstream operator or a downstream actor, subject to legal confirmation

Exposure discovery

Products, parts and suppliers screened against EUDR commodity and HS/CN applicability.

Recommend: Evaluate and prioritize risk and close due diligence gaps

Targeted supply chain verification

Validated multi-tier intelligence narrows verification to the flagged supply paths that carry EUDR exposure.

Deforestation validation

Confirmed plots checked against post December 2020 forest cover, commodity area, and land-use change layers.

Act: Resolve risk, approve the record, and submit

Supplier evidence collection

Targeted requests for producer identity, geolocation, legality evidence and upstream DDS, tracked to mitigation and closure.

DDS generation and submission

Statements generated, then lodged to the EU Information System via an integrated partner, with reference and status captured.

Direct submission (roadmap)

Native submission and status tracking directly to the EU Information System, planned for a subsequent release.

One connected record links the product, operator, supplier path, plot evidence, risk assessment, mitigation, approvals, DDS reference, and status. Governed access and a complete audit trail preserve the record after submission.

EUDR compliance in multi-tier supply chain context

WHY RESILINC

- 1. Supply chain context behind every compliance record:** Other tools on the market for EUDR compliance require you to upload all your supplier information upfront and hand back a prioritized risk list. Resilinc's agentic EUDR solution works across connected product, material, supplier, site and evidence data, automating the identification of potential exposure, surface where the obligation may sit, prioritize gaps and coordinate supplier follow-up, carrying records toward DDS readiness, tracking and even submission to EU TRACES.
- 2. Supplier-validated, multi-tier intelligence:** EUDR-relevant materials are connected to the products, parts, suppliers and sites behind them using multi-tier supply chain intelligence, Autonomous Mapping and supplier validation. Verification then focuses on the supply paths that carry EUDR exposure instead of the entire network.
- 3. First-mile geospatial intelligence:** Integrations with first-mile geospatial traceability providers extend visibility toward the point of production, identifying potential production locations and validating confirmed ones through plot-level analysis. That evidence is connected back to the relevant supplier, material, product and DDS record.

Human oversight on key actions

Autonomous Mapping + supplier validation

Governed agent access

Audit-ready evidence records

Human in the loop

Supplier outreach and DDS submission require explicit approval, with role-based approval rights and an audit trail behind every decision.

The operator remains accountable for the final due-diligence conclusion.

About Resilinc

Resilinc, a leading supply chain risk management solution, empowers companies to predict, mitigate, and quickly respond to disruptions. Our AI-powered supplier-customer collaboration platform backed by supplier-validated data provides real-time disruption monitoring, deep sub-tier visibility with part-site mapping, and predictive analytics. Resilinc enables companies to identify, analyze, and manage risks like compliance, supplier performance, extreme weather, and geopolitics to ensure operational resilience and a competitive advantage.
